

1. The definition of a spacecraft.
2. Assessment of energy costs for orbit-to-orbit manoeuvres.
3. Main specifications of the spacecraft.
4. Propulsion system in the spacecraft structure.
5. Classification of spacecraft by application and purpose.
6. Truss-type spacecraft.
7. The structure of the main spacecraft systems.
8. Aerodynamic stabilization of the spacecraft.
9. Classification of spacecraft by their design features.
10. Magnetic stabilization of the spacecraft.
11. The structure of the main compartments of the spacecraft.
12. Spacecraft airtight container design.
13. General requirements for the spacecraft structure.
14. Spacecraft unpressurized pallet structure.
15. Flight control system of the spacecraft.
16. Schematic design of the spacecraft.
17. Basic stages of spacecraft design.
18. Spacecraft crew life-support system.
19. The peculiarities of remote sensing spacecraft and weather observation spacecraft.
20. Pneumatic / hydraulic system of the spacecraft.
21. Pre-schematic design of the spacecraft.
22. The structure of the space system.
23. The criteria for assessment of the designing process outcomes.
24. Ground tests of the spacecraft.
25. Engineering requirements to the spacecraft design.
26. Physical conditions of the space flight.
27. Features of the design of small and micro spacecraft.
28. Features of interplanetary spacecraft.
29. Materials used for spacecraft structure.
30. Preparation of the spacecraft for the launch.
31. Operational requirements for the spacecraft design.
32. The technical area of a cosmodrome.
33. Gravitational control of the spacecraft.
34. Features of interplanetary spacecraft.
35. Scope and trends of space development.
36. Characteristics of manned spacecraft.
37. Global space market.
38. Lagrange variational principle.
39. Internal force factors, differential relationship in torsion.
40. Characteristics of manned spacecraft.
41. Loads affecting the spacecraft.
42. Castigliano variational principle.
43. Thin-walled closed section beam torsion.
44. Features of the communications spacecraft.
45. Detailed design of the spacecraft.
46. Least work principle.
47. Thin-walled open section beam torsion.
48. Rayleigh–Ritz–Timoshenko method.
49. Safety factor.
50. Formulation of problem solving in stresses.
51. Thermal strains and stresses.
52. Finite element method.
53. Statically determinate frame structure calculation.
54. Straight rod tension.
55. Bubnov-Galerkin method.
56. Pumping and pressurized system for propellant components supply.
57. Thermal protection techniques for rocket and space equipment.

58. Classification of mathematical models used for the development and application of rocket and space equipment.
59. Structural features of liquid rocket engines.
60. The basic surface deviation and undulation.
61. Rocket propellant components. High-boiling and cryogenic components.
62. Their sizes. Maximum deviation. The definition of access and landing. Depicting access and landing in technical drawings.
63. Structure and placement of reinforcement in the propellant tanks of space-based rocket.
64. The main axonometric projection. Types and sections in mechanical-engineering technical drawings.
